Amdt. Dated: September 25, 2006 Reply to Office action of: July 14, 2006

## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## **Listing of Claims:**

1 Claim 1 (Canceled)

- Claim 2 (Currently Amended): A multisystematic

  volume rendering image processing system comprising:

  a plurality of image data server computers,
- a plurality of image display units,
- one or more common volume data storage units for
- 6 storing volume data necessary for the image display
- 7 units, and
- 8 a server manager for managing data copying via a
- network, wherein the image data server computers receive
- volume data necessary for formation of images requested
- 11 by the image display units from the volume data storage
- unit via the network, process image data in accordance
- with image requests concerning angle and position issued
- 14 from the image display units, and transmit image results
- to the image display units via the network;
- the image display units each including an input
- 17 section and an output section transmit the image requests
- 18 entered through the input sections to the image data

42

server computers via the network, receive the image 19 results processed by the image data server computers and 20 output the image results to the output sections; 21 the volume data storage unit transmits the necessary 22 volume data to the image data server computers in 23 accordance with requests issued from the image data 24 25 server computers; and the server manager makes a decision to switch data 26 processing for the plurality of image display units so 27 that a part of the data processing performed by an 28 operative one of the image data server computers will be 29 replaced by data processing performed by another 30 suspended one including a state of low load of the image 31 data server computers The multisystematic volume 32 rendering image processing system as claimed in claim 1, 33 wherein when the server manager decides the switching, if 34 the same volume data as the volume data handled by the 35 36 operative image data server computer are not present in the suspended image data server computer as a destination 37 of the decided switching, the server manager performs a 38 control function wherein the volume data from the volume 39 40 data storage unit is transmitted to the destination image data server computer and additional information is copied 41

from the operative image data server computer to the

Amdt. Dated: September 25, 2006 Reply to Office action of: July 14, 2006

- 43 destination image data server computer, and the
- 44 destination image data server computer is made to execute
- 45 the data processing.
  - 1 Claim 3 (Currently Amended): The multisystematic
  - volume rendering image processing system as claimed in
  - 3 claim 2[[1]], wherein the decision to switch data
  - 4 processing is based on anwhen overload condition of the
- 5 <u>operative</u> is imposed on computation of volume rendering
- 6 which is being carried out by a first image data server
- 7 computer, the server manager judges whether to make a
- 8 part of the volume rendering be handed over to a second
- 9 image data server computer having idle computation
- 10 resources or not; and
- 11 when a decision is made that the part of the volume
- 12 rendering is handed over, the server manager performs a
- 13 control function wherein volume data handled by the first
- 14 image data server computer is transmitted from the volume
- 15 data storage unit to the second image data server
- 16 computer and additional information is copied from the
- 17 first image data server computer to the second image data
- 18 server computer, and the second image data server
- 19 computer is made to execute the data processing which is
- 20 heretofore executed by the first image data server

21 computer.

22

Claim 4 (Currently Amended): The multisystematic 1 2 volume rendering image processing system as claimed in claim 2[[1]], wherein the server manager stores 3 identification names of the volume data transmitted from 4 the volume data storage unit and destination image data 5 6 server computers in a memory in advance; 7 when the volume data storage unit is requested to send volume data, the server manager inquires of the 8 memory whether the same volume data are already sent or 9 not, after the volume data is sent from the volume data 10 storage unit; 11 when the same volume data are already sent, the 12 13 server manager judges whether the volume data are collected to one of the image data server computers or 14 15 not; and when a decision is made that the volume data are 16 collected to one of the image data server computers, the 17 server manager performs a control function wherein 18 19 additional information is copied to that from an image 20 data server computer to be suspended to another image data server computer as a destination of the decided 21

switchinghandover of the volume data and the handover
